

Environmental policy

Introduction

RAMA, according to the Continuous Improvement as boosted in the Total Quality approach, commits itself to perform an Environmental Management System based in contamination prevention worldwide.

This commitment has a greater scope than simply to comply with laws, as it includes a series of acceptable practices for the Environment within the field of Company decisions.

We undertake to:

- Boost the continuous improvement of our environmental behaviour.
- Ensure compliance with the Environmental Laws and Regulations applicable to our activities, products and services as well as Customers Standards and any other applicable environmental requirement.
- Boost activities related to the design of products with cleaner production processes, and characteristics that may optimise their recycling and re-utilisation possibilities
- Preserve resources and energy; reduce the use of dangerous products and the generation of dangerous and non-recycle waste
- Encouraging suppliers and subcontractors to adopt the same environmental principles as RAMA
- Manage own processes in order to decrease impact of production of greenhouse gases, drinkable water consumption and quality, and pollution of surface water and in order to not increase the quality of air pollution
- Use only environment-friendly chemical substances from approved and certified suppliers and current chemical substances will be timely exchanged/replaced by environmental-friendly chemical substances
- **Perform energy management activities to use renewable energies including electricity**
- Let the people know the Environmental Policy
